University of Dhaka

MITM 421 — Project for MIT / Internship

Student Guidelines

Student Checklist

Before Starting

- Get problem statement and scope approved by supervisor
- Set up a Git repo — commit regularly and incrementally from day one
- Understand the AI-use disclosure requirement (allowed, but must be disclosed and understood)

Midterm Prep

- Be ready to justify every major design/tech-stack decision ("why this, not X?")
- Have a working prototype you can modify live, on the spot, without notes
- Bring a realistic timeline with identified risks

Ongoing (Every Supervisor Meeting)

- Come prepared with specific progress, questions, and blockers — not just "it's going fine"
- If you used AI tools, be able to explain what you asked for and what you changed/fixed
- Don't let weeks pass without supervisor contact

Before Final Defense

- Be able to explain **any** part of your codebase, including AI-generated sections, line by line
- Practice explaining your code cold — not just the parts you rehearsed in your demo
- Prepare for a live modification or bug-fix task under time pressure
- Know your system's limitations, failure modes, and alternative approaches you considered

Report Writing

- Write your own analysis/discussion sections — don't submit AI-generated prose unedited
- Include a clear, specific AI-tool-use disclosure section (what was used, for what, what you changed)
- Make sure the report matches what you actually built, not an idealized plan
- Cite sources properly; check for plagiarism/AI-text flags before submitting

Golden rule: if you can't explain it, don't submit it — you will be asked to defend every part of your project live.
